problem definition

- According to WHO globally there are 1.5 billion deaf people and this number could increase to 2.5 billion by the end of 2050.
- Difficulty in participating in verbal conversations
- Difficulty in forming and maintaining social relationships
- Limited access to public services and facilities that are deaf-friendly
- Difficulty in using telecommunication devices that rely on sound

Project idea

make an application to Recognition of hand gestures in 3D space using a single low resolution camera for converting Sign Language into any spoken language.

use cases:

- Deaf people can have a common classroom by asking their questions/doubts without any hesitation
- Inclusion of this community in normal schools.
- Tourist Guides can communicate better using sign language.

HOW DO WE DO THAT?

► Machine Learning

Machine Learning is a branch of artificial intelligence that enables computer systems to learn and evolve from data without being explicitly programmed.

Machine Learning

► Deep Learning

Deep Learning is a subset of machine learning that uses deep neural networks to mimic the way the human brain processes data and makes decisions.

Driving

Types of neural networks

1. Convolutional Neural Networks (CNN)
2. Recurrent Neural Networks (RNN)
3. Feedforward Neural Networks (FFN)

computer vision:

- seeks to automate tasks that the human visual system can do
- Goal of computer vision: to bridge the gap between pixels and meaning

usage in our project

- we will use computer vision to detect hand and recognize the movement and know what is the meaning of the sign and give me that in output like sound

computer vision can be achieved by:

- Classical image processing methods
- Deep learning methods

► Computer vision:

Computer Vision is a field of artificial intelligence and machine learning that enables computers to interpret and understand digital images and videos.

► Computer vision:

Image Recognition

Identifying and classifying objects or people in images.

Object Detection

Locating various objects within images and videos.

Face Recognition

Identifying individuals based on their facial features.

The most important libraries used

AiTP

▶ OUR TECHNOMAGIC

1. Statistical analysis
2. Image processing
3. Scientific model simulations
4. Machine learning

1. Facial recognition
2. Object detection
3. Medical image processing
4. Robotics

1. Deep learning in image processing
2. Natural Language Processing (NLP)
3. Generative Adversarial Networks (GANs)
4. Personalized recommendations

1. Hand tracking
2. Face detection
3. Human pose estimation
4. Hair and skin segmentation
